

Protocol Analysis

Wireshark Lab

Requirements: webserver as target

Work on in lab, or as homework (using your IP address)

- Protocol/Packet/Network Analyzers (aka Network Sniffers) capture and decode network traffic
- Captures can be saved for later review (.pcap)
 - ◆ Analyze network problems
 - ◆ Debug client/server problems [Coder tool]
 - ◆ Monitor malware activity
- Wireshark is free www.wireshark.org
 - ◆ Multiple platforms w32, w64, OS x
 - ◆ Wireshark works on most wireless LANs
 - ◆ Wireshark can capture raw USB and Bluetooth traffic
- Microsoft Network Monitor is another free protocol analyzer

Protocol Analysis

Learning Objectives

Upon completion of this exercise, students will be able to demonstrate:

- How to use a protocol analyzer to capture network traffic
- How a TCP segment is constructed and explain the segment fields
- How a TCP segment is constructed and explain the segment fields
- How to interpret packet decodes for protocols and applications

Additional Resources

Video Tutorials & Docs. at: <http://www.wireshark.org/docs/>

- Introduction to Wireshark
- The Case of the Missing Download
- The Case of the Slow Network
- The Case of the Slow Web Server
- Lab Configuration

Packet Analysis

List of packets captured

Details of the selected packet header

Contents of the packet in hexadecimal and ASCII

Protocol Analysis

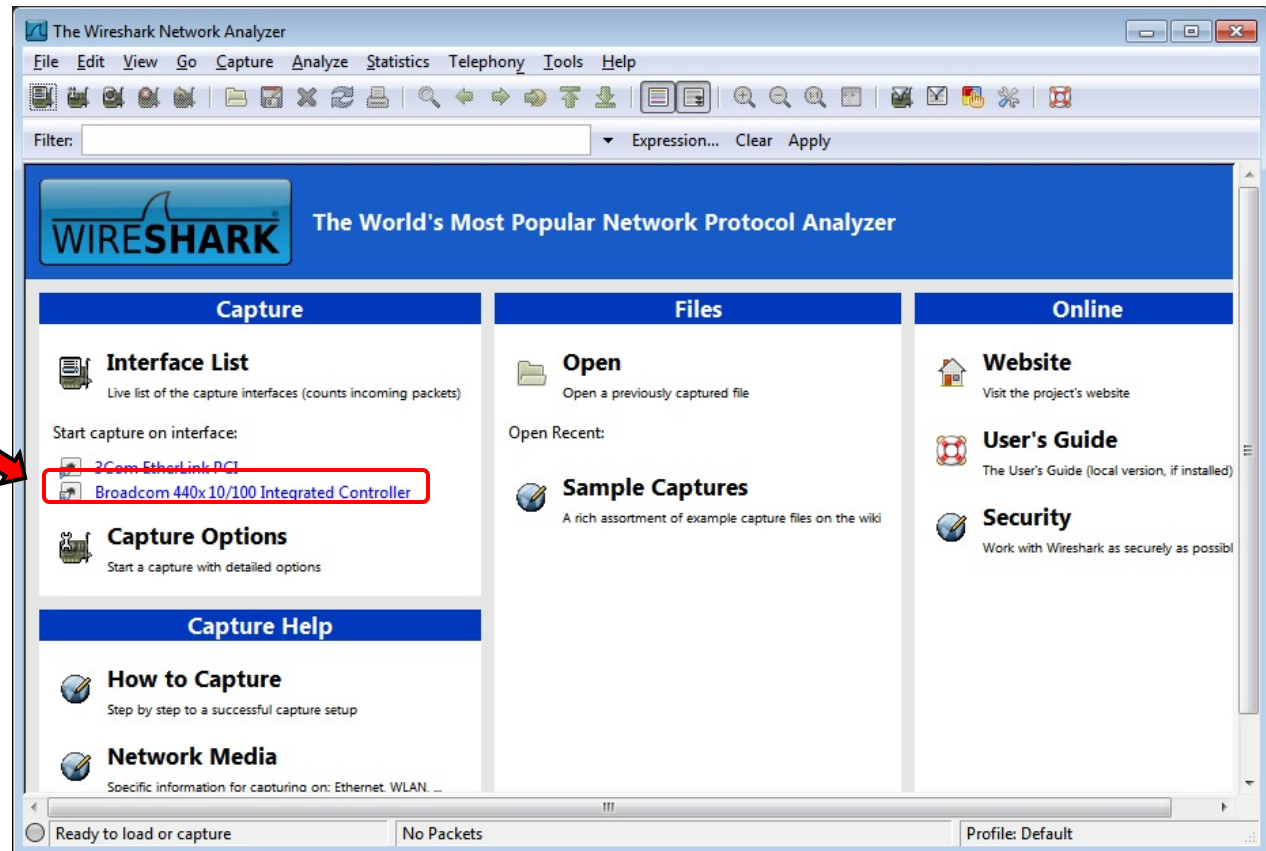

Use either the Windows 7 partition or boot from a BackTrack DVD

Note: Lab computers have multiple network cards – only the built in NIC (eth0) is connected. Verify that the computer has a correct network address, BackTrack will need to be manually configured.

If there is no shortcut, look for Wireshark in c:\tools

Use built-in NIC

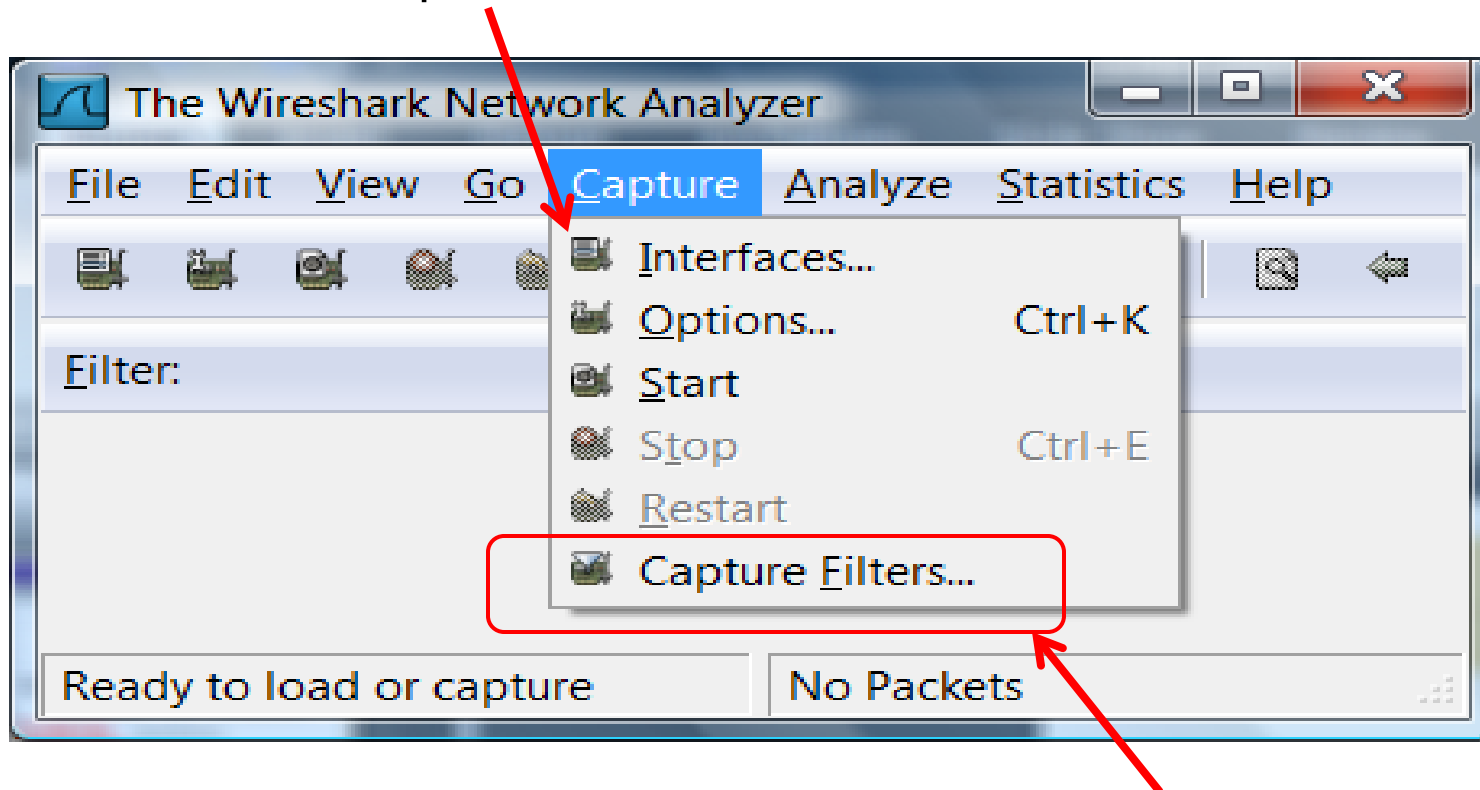

Shortcuts to start capturing

Protocol Analysis

- You can also use the menu for starting captures
 - ◆ Start Wireshark
 - ◆ Select Capture/Interfaces

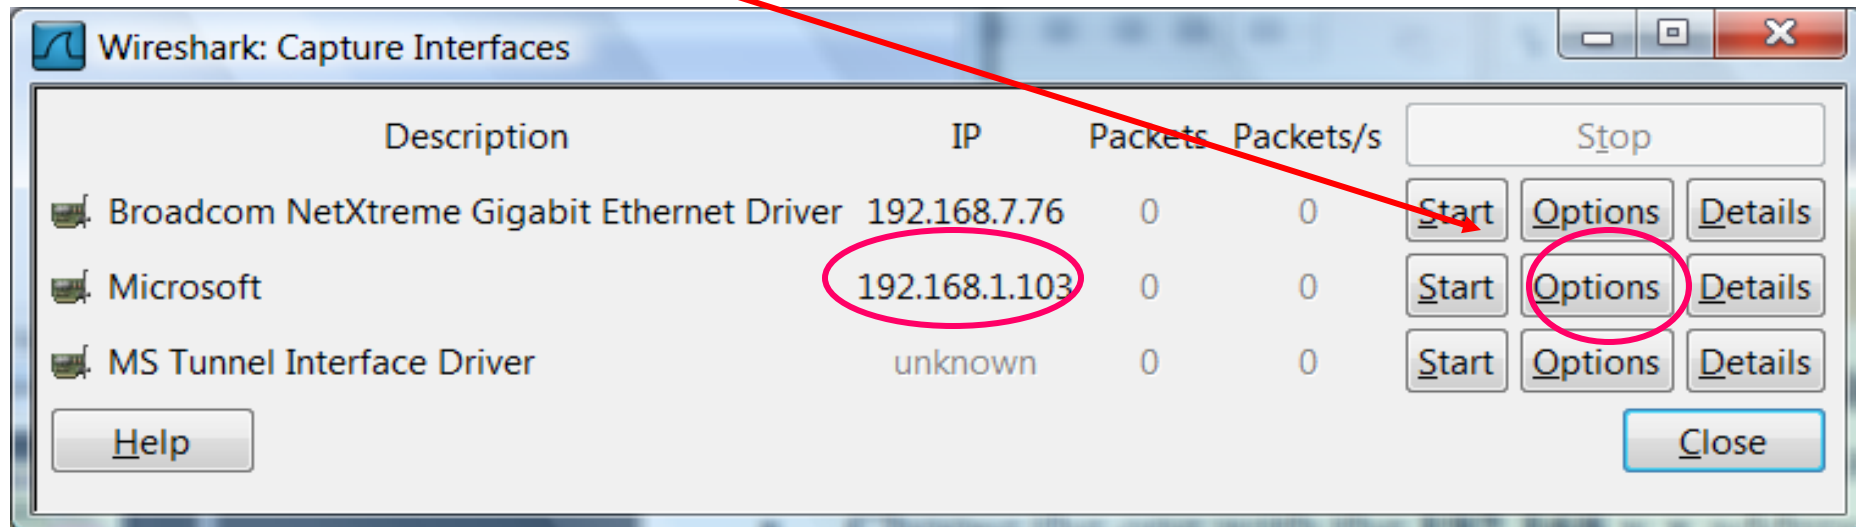

Explore how filters work – then set them here

Protocol Analysis

- Make sure the lab computer has a 192.168.11.x address
- Select the interface with that address in Wireshark
- The names of the network interfaces will vary!
- Choose the one with the 192.168.11.x address
- If in doubt, ask! $x = 101$ to 199
- Click on the Options for that interface

This window appears:

- “Capture packets in promiscuous mode” is set by default
- Check these
- Click on Start

Wireshark: Capture Options

Capture

Interface: Microsoft: \Device\NPF_{947E3C4F-5022-4571-8347-B49D505F254D}

☐ ... after 1 megabyte(s)

☐ ... after 1 minute(s)

Help Start Cancel

Protocol Analysis

- Wireshark uses the NIC in promiscuous mode, e.g. the NIC will pass all traffic on the wire to Wireshark
- Filters can help improve the signal to noise ratio
- The below example of lab traffic shows:
 - ◆ A VM with an incorrect static IP
 - ◆ DHCP requests – but no server is running to reply
 - ◆ Cisco spanning tree protocol
 - ◆ Collectively: *Noise* Filters reduce noise

No.	Time	Source	Destination	Protocol	Info

Protocol Analysis

You need a webserver to establish a TCP connection with

Use the webserver at 192.168.11.4

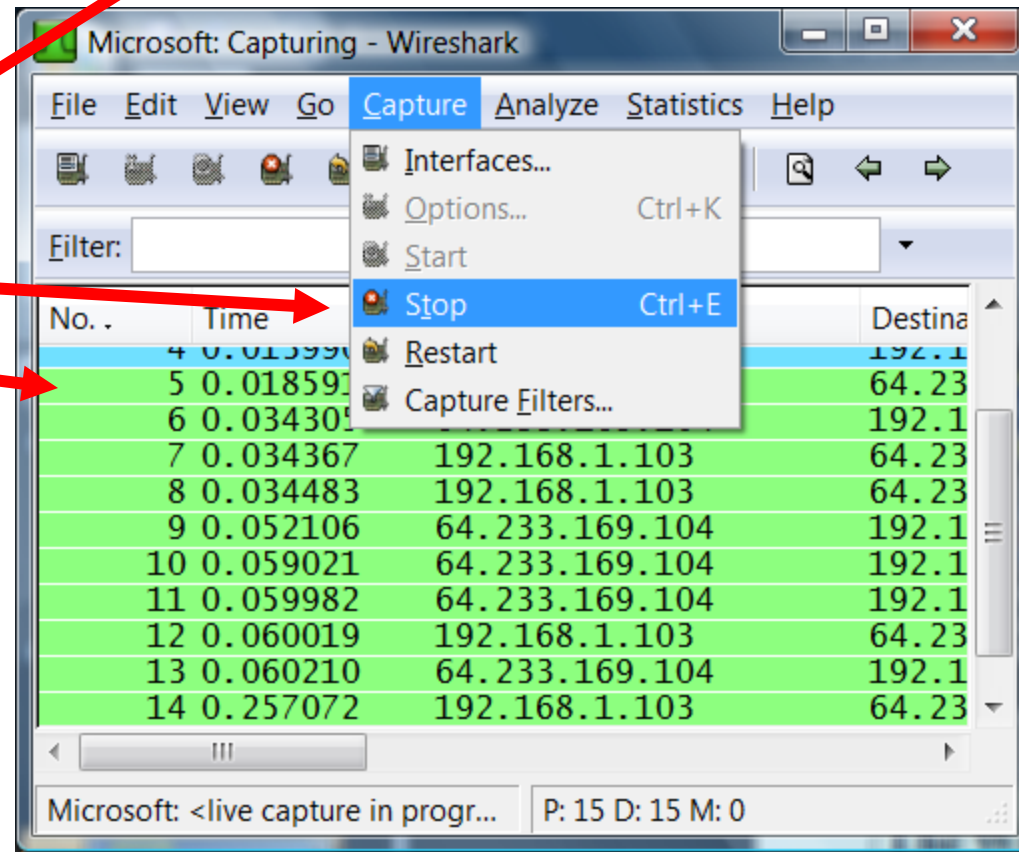

If homework – use any webserver

- Once 'capture' window appears
- Open up a web browser
- Visit: *
- Close the website (x)
- Click on Capture/Stop
- Results window appears

- See lab assistant ..it will be a webserver in the target address range – use it's IP address

Protocol Analysis

- **Select the SYN packet**
- In the middle frame, see: **Frame & Ethernet** sections
 - ◆ Here find the source (your) MAC address
 - ◆ Look for something like 00:11:43:a8:0c:22
- An **Internet Protocol** section
 - ◆ Find the value of the “Time to live” (TTL) flag
 - ◆ What is the value?
- A **Transmission Control Protocol** section
- Here find the Header Length (it's not 20 bytes – what was added in the Options field? Hint: Your client is telling the server something.)
- Repeat, looking at SYN-ACK packet sent by server
- Note: Maximum Segment Size (MSS) = largest packet you can send

1. Right-click anywhere in the middle frame, e.g. here

2. Select "Expand All"

Lab Objectives

Easier than C++ ?

Initial Exercise

Obtain the following information:

- The source IP address
- The IP address of the Web server
- The source (your) MAC address
- The value of the IP TTL (Time to Live) field

If you have any problems finding the above

– work with the Lab Assistant

Penultimate Exercise

- Start capturing packets in Wireshark
- Ping one of the servers or lab computers
- When the Ping program is done, stop the Wireshark packet capture
- The capture window shows Ping queries and responses
 - ◆ What is the Internet Protocol number for ICMP?

Protocol Analysis

Lab Exercise (continued)

- Start capturing packets in Wireshark. Have your host send and receive several UDP packets. After stopping packet capture, set your packet filter so that only UDP packets sent and received at your host are displayed. Select one UDP packet and expand the fields in the details window.
- Select one packet. From this packet, determine how many fields there are in the UDP header. Name the fields.
- From the packet content field, determine the length (in bytes) of each of the UDP header fields.
- The value in the Length field is the length of what?
- What is the largest possible source port number? Why?
- What is the protocol number for UDP?

Lab Assignment

Name:

1. Source IP address
2. Destination IP address
3. Source MAC address
4. IP TTL
5. IP Protocol number for ICMP
6. Names of UDP header fields
7. Length of the UDP header fields (in bytes)
8. Value of length field is the length of what?
9. Value of largest possible source port number?
10. Why?
11. UDP Protocol number
